ACKNOWLEDGEMENT

Firstly, we would like to say thank you to God for giving us wisdom and strength throughout this journey. We also want to thank our parents for supporting us; without their support we cannot do this. Also, we acknowledge our adviser, Ma'am Chrischel Joy Lorenzo, for helping, guiding, and reminding our group to work everything out. We really appreciate your help and support. This is not just our victory but also the people behind us. We would also wish to express our sincerest appreciation to our mentors and teachers who have accompanied us through our studies. Your dedication, patience, and encouragement have inspired us to strive harder and aim higher. The values and knowledge you have instilled were instrumental in forming the people we are today, and for that, we are ever grateful. To our classmates and friends who stood by us and offered their support in times of stress and uncertainty, thank you. Whether it was through words of encouragement, shared resources, or simply being there to listen, your presence made a big difference. Your belief in us gave us the confidence to keep moving forward, even during the most challenging times. Lastly, we thank every individual who, in one way or another, contributed to the success of this project. From those who participated in our research, gave feedback, or simply offered moral support — your contributions did not go unnoticed. This achievement is not just a reflection of our hard work but a collective effort of a community that believed in us from the very beginning.

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

ABSTRACT

As consumers and a business-minded individual we seek an affordable rate,marketplaces like wet markets and malls, these often add on prices. Most sellers are likely to catch their quota and divide it along with their expenses when renting a place. Lastly, we look for budget-friendly poultry products and want to make our own business like other pop-up carts in the streets or just simply have a supply or be a reseller.

Improving our wholesaler poultry price is the best way to have a business. Therefore, we are creating a system that will interact with the store and can be used, Therefore you can transact orders. The customer can sign up and register and directly see the prices and total of take orders, then can pick-up.

College of Information Technology Education

INTRODUCTION

Poultry products were important to consumers in everyday life and were considered a basic human need. Starting a business was also a source of livelihood, and for this type of business—whether as a consumer or a reseller, it was essential to have budget-friendly prices. This project was suitable for all consumers and establishments such as restaurants, pop-up carts selling street food, and resellers, and especially for those who wanted to start a business like this.

The system operated through an online ordering & reservations platform at Eycapacio Poultry, also known as EYC Trading. The store was located at QMF Subdivision. At that time, EYC Trading continued to uphold its tradition of quality and service. They took pride in their journey and remained committed to delivering the finest poultry product.

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

Background of the Study

During a time when inflation was a primary concern, people could no longer ensure that their budget for necessities could purchase as much as before. The average prices and variations of poultry products became unbalanced, depending on store supply or supplier availability. As technology evolved, so did the customers' desire to search for affordable poultry products and to learn more about what they were buying. This enabled us to assist customers and business seekers in finding better supplies at lower prices they could rely on.

The Online Ordering & Reservations platform offered wholesale poultry products at prices lower than those in wet markets or grocery stores. This was exactly what customers, consumers, and business seekers needed in this generation. The owner, Mrs. Joilyn Capacio, remained very hands-on in managing the business, despite also being a sub-dealer of frozen foods.

The Online Ordering & Reservations system gave people the option to start a business or to have EYC Trading as their supplier for their market stalls, restaurants, and other ventures. It served as their initial step toward starting a business and helped new business seekers consider what kind of business they could launch using poultry products.

STATEMENT OF THE PROBLEM

Many consumers and small business owners struggle with the high prices of products in the marketplace. These high costs make it difficult for them to manage their budget and continue their business operations. Restaurants also face the same issue, as they need to maintain affordable prices for their customers while keeping up with their own expenses. Because of this, there is a need for a reliable wholesaler that can provide quality products at budget-friendly prices to help consumers, restaurants, and small business owners meet their needs without overspending.

OBJECTIVES OF THE STUDY

The primary objective of this study was to develop an efficient and user-friendly online ordering and reservation system for Eycapacio Poultry & Livestock Products Corporation. The system aimed to streamline business operations, enhance customer experience, and improve order management by leveraging modern e-commerce technologies.

SIGNIFICANCE OF THE STUDY

The implementation of our Online Reservation System can significantly benefit customers by providing wholesale prices and reducing hassle and inconvenience. The system requires customers to provide their contact numbers, enabling the office and staff to easily communicate with them regarding order updates and delivery arrangements. Although the company does not have dedicated riders, the system allows customers to arrange for pickup or delivery, and staff will work with them to find a suitable solution, whether through a third-party rider or alternative arrangements, ensuring timely and efficient order fulfillment.

SCOPE AND LIMITATIONS

This study focused on consumers and business owners by offering an online ordering and reservation system for people who needed to start a business or act as suppliers. It worked only if the user had a stable internet connection. The system was applicable only for pickup transactions and if you have ordered 5 or more items, home delivery is available, but this transaction is going to be arranged, whether through a third-party rider or alternative delivery options.

Our system had embedded the exact address of the office and contact information, which served as both the store and workplace. The transactions were limited to pickup services only. Since the owner did not yet have a dedicated community rider, each delivery order had to be arranged individually according to the date and time scheduled by the customer for every transaction. Despite this, the staff will work with them and contact them within 24 hours to find a suitable solution or alternative arrangements for delivery orders, the system was designed to be hassle-free for customers, allowing them to track their order status through reference number without having to wait unnecessarily. Our system also supports GCash payments through a QR code, manages cash flow and daily sales, generates official receipts (OR) after each order, and monitors product inventory including stock in and out.

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

Chapter 2

LITERATURE REVIEW

Several studies have explored the use of online ordering and reservation systems to improve customer convenience and business efficiency. According to Garcia (2021), online food ordering platforms reduce waiting time and enhance customer satisfaction by allowing users to place orders ahead of time. Similarly, Lopez and Tan (2020) emphasized that reservation systems help minimize congestion and provide a more organized service flow in food establishments.

Research by Singh et al. (2022) found that e-commerce technologies have transformed traditional business models, particularly in the food and agricultural sectors. These systems not only make transactions faster but also improve inventory management and communication between suppliers and customers. In the poultry and livestock industry, where products are perishable and demand fluctuates, technology plays a vital role in maintaining efficiency and ensuring timely delivery (Martinez, 2023).

PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

Overview

The Online Ordering & Reservation System was designed for consumers, restaurant owners, resellers, and those who were willing to start a business. Built using advanced internet technology, the system was user-friendly and easy to transact with, provided the user had a stable internet connection.

The Online Ordering & Reservation System of EYC Trading offered robust functionality for user transactions. It provided budget-friendly options for consumers, re-sellers, and restaurant owners, making it a good starting point for those looking to begin a business. The system allowed users to view products and prices. It gave access to the user interface, where customers could add desired products to their cart and view store information. At that time, EYC Trading was one of the most affordable poultry product providers through its Online Ordering & Reservation System. Its modular architecture enabled consumers to explore business opportunities with ease.

2.2 In today's fast-paced world, where technology has invaded every aspect of life, inflation was no exception. Traditional methods of budgeting for poultry and other necessities had become increasingly obsolete. As stores strive to meet the demands of modern budgeting and provide cost-effective solutions for both consumers and resellers, the adoption of an Online Ordering & Reservation System became essential.

The Online Ordering & Reservation System was defined as a comprehensive platform that brought together consumers, business owners, re-sellers, and quality poultry products in a timely, affordable, and budget-friendly manner. Traditionally, sourcing poultry products was expensive and time-consuming, and prices often did not vary significantly in the market. On the contrary, in a competitive environment, many markets increased prices to meet sales quotas.In this context, the Online Ordering & Reservation System served consumers, re-sellers, and aspiring business owners. Built on modern technologies, the system was both user-friendly and budget-friendly, offering a convenient solution for sourcing poultry products in a competitive and inflation-driven economy.

Tecnology Use

This section describes the entire technology implemented for the Online Ordering and Reservation System. The system has a contemporary, serverless architecture. This architecture assists in attaining scalability, real-time capabilities, and a seamless user experience. These modern observation tools are, however, run by PHP to support session data, user authentication, and analytics. Data is mostly saved in relational databases such as MYSQL for these systems.

Traditional VS Modern System

The traditional ordering process at Eycapacio Poultry & Livestock Products Corporation relied heavily on manual operations, which tended to be time-consuming, inaccurate, and inefficient. The contemporary online ordering and reservation system, on the other hand, applies web-based technologies to automate transactions, offer real-time information, and facilitate better communication between customers and personnel. This change makes the business more efficient, accurate, and customer-friendly, conforming to the requirements of a digitally oriented marketplace.

Case Studies

The number one thing customers wanted with their takeout was the convenience of online ordering. A study on the rise of online ordering systems revealed that 51% of Americans had used a restaurant delivery service to purchase meals, and 26% ordered at least once a week. Research by Hunger-rush showed that 79% of diners expected the option to use technology when ordering from casual restaurants. Nearly one-third of all adults—and 41% of people aged 18 to 34—considered the availability of technology options an important factor when choosing restaurants. In an era driven by immediacy, customers had come to expect that food ordering would be effortless, available around the clock, and right at their fingertips. The online ordering industry alone was worth $5 billion during the first two quarters of 2018, and some experts predicted that the food delivery market could reach a value of $365 billion by 2030. Although online ordering was already growing in popularity, it became even more critical in recent years. An online ordering system helped streamline a restaurant’s curbside takeout process, simplified food ordering, and became a valuable source of ongoing revenue.

While getting started with such a system often involved significant operational changes, guidance was available to break the process down. This article aimed to cover everything needed to prepare for and implement an effective online ordering system.

Chapter 3

Methodology

The research method applied the System Development Life Cycle (SDLC) framework, involving both quantitative and qualitative methods to provide an in-depth examination of the Online Ordering & Reservation System of Eycapacio Poultry. The process began with planning and the conduct of feasibility studies, which determined system goals and assessed feasibility. This was followed by the system design phase, where the architecture, user interface, and database structure were created.

During the development stage, coding was carried out and key features—such as order management and payment processing—were implemented. System accuracy and performance were thoroughly tested. After successful deployment, the system was made available to customers, with ongoing maintenance and support provided to resolve issues and implement enhancements.

Finally, an assessment phase was conducted to evaluate system effectiveness, using feedback gathered through surveys, interviews, observations, and document analysis. This feedback helped guide future improvements to the system.

Research Development Stage

One of the most important components of the Development stage is ongoing debugging, or the act of discovering and correcting errors in the codes and systems prior to the solution being ready for outside examination. As IT Students we prompt AI and fresh code and construct features, they run exhaustive internal testing, unit testing and alpha testing—to quickly detect and solve any bugs, performance problems, or instability. This required and continual attention to detail guarantees that the product is stable, dependable, and working properly, providing a sound foundation prior to proceeding on to subsequent phases of broader user testing and verification.

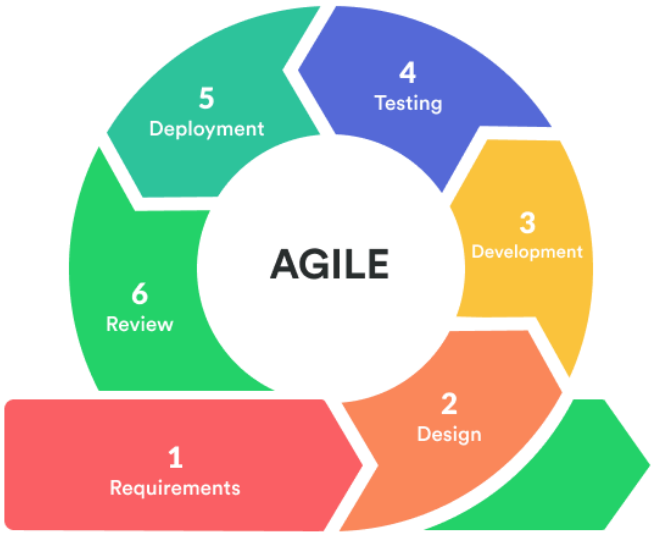
PHINMA UNIVERSITY OF ILOILO

College of Information Technology Education

Research Design

This study employed a mixed-method approach, integrating both quantitative and qualitative methods to assess the development and implementation of the Online Ordering & Reservation System for Eycapacio Poultry & Livestock Products Corporation. The quantitative aspect focused on measuring the system's performance, and efficiency through statistical data.

Model Use



1) Planning - During the planning phase, the team gathered initial requirements by identifying the problems faced by consumers and business seekers in accessing budget-friendly poultry products. The feasibility of building a system that enabled online ordering and reservations was analyzed. The main goals were to simplify transactions, support re-sellers, and provide an affordable supply chain solution.

2) Design - The system design phase focused on creating the system architecture, including the user interface for both customers and staff, the product catalog, and the database structure. The interface was designed to be user-friendly, allowing customers to add items to a cart, and make reservations.

3) Development - In this phase, the prototype was developed using web technologies such as HTML, CSS, Bootstrap, and a database management system. Development included user functionalities like registration, login,settings, and add cart system.

4) Testing - The system also went through different levels of testing, such as unit testing for single components, integration testing to check that modules were working well together, and user acceptance testing (UAT), where staff and targeted customers engaged with the system to see if it met their needs. Observational feedback was gathered to identify usability issues and make improvements.

5) Deployment - After successful testing and integration of feedback, the system was deployed in a live environment. It became accessible to users, and staff were trained to manage online reservations and monitor orders. The system was officially used for real transactions, including pickups.

6) Review - Post-deployment, feedback was collected from users, business owners, and staff to evaluate the system's performance, identify bugs, and measure customer satisfaction. Surveys, interviews, and analysis of order records were conducted to assess the system's effectiveness and guide future updates and enhancements.

CHAPTER 4

Result and Discussion

The result and discussion section provides the output of the system development, implementation, and assessment of the Online Ordering & Reservations System for Eycapacio Poultry & Livestock Products Corporation. This section is centered on the usability of the system, user assessment findings, and learnings derived from the survey and feedback sessions. The system was created with a focus on overcoming manual ordering issues, transparent pricing, and business effectiveness, while enhancing customer/reseller convenience and accessibility.

System Features

The system was built with HTML, CSS, and Bootstrap to create a responsive and easy-to-use interface for desktop. It offered a simple ordering process that let customers pick between "Pay Now" or "Pay Later" options, with order statuses like "waiting," "confirmed," "cancelled," or "completed." For admin, there was a detailed dashboard where they could manage customer inquiries, and oversee customer transactions. The system also kept a complete transaction history for admin, and accountability. Furthermore, the platform had a map feature that made it easy for users to find service points. Income tracking tools were included to monitor financial performance, while dynamic charts showed data on sales, and transaction records. This helped administrators make smart decisions.

System Code

```
> admin > src > check_new_orders.php

<?php

require_once '../../connection/db_connect.php';

// Get the latest pending order

$stmt = $pdo->query("

    SELECT order_id FROM orders

    WHERE status NOT IN ('completed', 'cancelled')

    ORDER BY order_date DESC

    LIMIT 1

");

$order = $stmt->fetch(PDO::FETCH_ASSOC);
```

```
echo json_encode([
    'new' => $order ? true : false,
    'latest_order_id' => $order['order_id'] ?? null
]);

> admin > src > dashboard.php
<?php
require_once 'middleware.php';
require_once '../../connection/db_connect.php';
// Fetch statistics
try {
    // Total Orders
    $stmt = $pdo->query("SELECT COUNT(DISTINCT
order_id) as total_orders FROM completed_orders" );
```

```
 $totalOrders = $stmt->fetchColumn();

    // Completed Orders

    $stmt = $pdo->prepare("SELECT COUNT(DISTINCT
order_id) as completed_orders FROM completed_orders
WHERE status = 'completed'");

    $stmt->execute();

    $completedOrders = $stmt->fetchColumn();

Implementation Challenges

During development, Some issues were faced during development, including the integration of functionality like cart management and recording transactions. In the initial stages, problems were faced with database connectivity and authentication of users. These were resolved through repetitive debugging and backend logic tightening. The other challenge was maintaining responsiveness on different devices. The use of Bootstrap's framework facilitated overcoming this, maintaining a standardized user experience.

User Feedback

Feedback was collected through surveys, interviews, and observation. Users appreciated the convenience of being able to place orders online and view prices directly. Re-sellers and restaurant owners especially valued the ability to access wholesale pricing without visiting the store physically. However, some users suggested adding an SMS or email notification system for order updates, which the team noted for future enhancement. The staff also found the admin panel manageable and effective in monitoring daily transactions.

Key Findings

The research identified that the introduction of an Online Ordering & Reservation System greatly enhanced business efficiency and customer satisfaction for Eycapacio Poultry & Livestock Products Corporation. The system enhanced the ordering process, minimized manual mistakes, and expedited transactions with accuracy. Customers enjoyed the convenience of seeing wholesale prices, ordering online, and scheduling pickups easily without physically going to the store.

In addition, business processes were more streamlined with the inclusion of an administrative dashboard wherein employees could track orders, maintain inventory, and monitor daily sales. User and staff feedback indicated that the system improved communication, transparency, and ease of use. That being said, it also highlighted potential improvements such as the implementation of SMS or email alerts, more payment options, and a potential mobile application for greater accessibility.

Generally, the research asserts that embracing contemporary online systems in conventional business frameworks can enhance customer interaction, operational efficiency, and firm competitiveness within the online market.

Comparison to Other Systems

Compared to traditional methods and existing e-commerce platforms, the Online Ordering & Reservation System provided a more tailored solution for Eycapacio Poultry's target users. Unlike generic e-commerce platforms, this system focused specifically on poultry product transactions, pricing transparency, and pickup model. The inclusion of a budget-friendly product catalog, order tracking, and a user-friendly admin dashboard gave it a significant edge in terms of usability and practicality for small-scale business owners.

CHAPTER 5

Conclusion and Recommendation

Conclusion

The development and implementation of the Online Ordering & Reservation System for Eycapacio Poultry & Livestock Products Corporation successfully addressed the needs of consumers, re-sellers, and aspiring business owners seeking budget-friendly poultry products. The system streamlined the ordering process, improved accessibility, and provided a reliable platform for managing orders and customer transactions. It enabled users to conveniently browse products, and place orders, while also equipping the staff with tools to manage and track transactions efficiently.

Throughout the development life cycle, the team used the System Development Life Cycle (SDLC) approach, which guaranteed a structured process of planning, design, development, testing, deployment, and review. The system was accepted by users, and feedback gathered through surveys and interviews validated its usability and usefulness. The results demonstrated that integrating technology into traditional business processes could significantly improve customer satisfaction and operational efficiency.

Recommendation

Based on user feedback and system evaluation, the team recommended several enhancements to further improve the platform. These included integrating SMS or email notifications for order updates, expanding payment gateway options for greater flexibility, and adding a product review or rating system to boost customer engagement. It was also suggested that mobile app development be considered in the future to expand to reach and enhance user convenience.

Additionally, continued system maintenance and regular updates were advised to ensure stability and adapt to changing user needs. By implementing these improvements, the system could further support the business's growth and continue to meet the demands of a modern, tech-driven market.

Final Thoughts

Overall, the development of the Online Ordering & Reservation System for Eycapacio Poultry & Livestock Products Corporation served as a valuable learning experience for the researchers. It not only applied the technical knowledge gained throughout their academic journey but also addressed a real-world problem faced by small businesses and consumers. The project highlighted the importance of innovation, user-centered design, and continuous improvement in system development. Through collaboration, feedback, and dedication, the team was able to deliver a functional and meaningful solution that contributed to the modernization of traditional business practices. This project confirmed the capacity of technology to drive efficiency and foster opportunities for development within local communities.
